<sup>C</sup> Frequency validity above 300 MHz of ± 100 MHz only applies for DASY v4.4 and higher (see Page 2), else it is restricted to ± 50 MHz. The uncertainty is the RSS of the ConvF uncertainty at calibration frequency and the uncertainty for the indicated frequency band. Frequency validity below 300 MHz is ± 10, 25, 40, 50 and 70 MHz for ConvF assessments at 30, 64, 128, 150 and 220 MHz respectively. Above 5 GHz frequency validity can be extended to ± 110 MHz.

<sup>F</sup> At frequencies below 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) can be relaxed to ± 10% if liquid compensation formula is applied to measured SAR values. At frequencies above 3 GHz, the validity of tissue parameters ( $\epsilon$  and  $\sigma$ ) is restricted to ± 5%. The uncertainty is the RSS of the ConvF uncertainty for indicated target tissue parameters.

<sup>G</sup> Alpha/Depth are determined during calibration. SPEAG warrants that the remaining deviation due to the boundary effect after compensation is always less than ± 1% for frequencies below 3 GHz and below ± 2% for frequencies between 3-6 GHz at any distance larger than half the probe tip diameter from the boundary.

## Product Equality Declaration

We, HMD Global Oy declares on our sole responsibility for the product as below:

Certification information					
SKU	Row	LatAm	Row	LatAm	APAC
Number of SIM's supported	SKU1	SKU2	SKU1	SKU2	SKU1
	SS	SS	DS	DS	SS/DS
Model Name	TA-1020	TA-1028	TA-1032	TA-1038	TA-1020/ TA-1032

The differences between Row, Latam, APAC as below:

■ RF section

1. Antenna pattern and matching has no difference

## 2. Frequency band difference

#### ■ SW section

There is no different for SW design. Only the UI will show different model name.

#### ■ Mechanical section

There is only one different for the structure of SIM Card. For hardware system design is the same.
